

ABSTRACT OF THE DISCLOSURE

1
2
3 An internal fixation pin comprises first and second portions
4 with threads of different diameters, but having the same pitch and
5 thread depth. The first portion includes a self-tapping tip.
6 No enlarged head portion is provided to the pin at the end
7 opposite the tip. A non-threaded shaft portion is frangibly
8 connected to the second portion and is a mechanism for rotating
9 the pin for threaded insertion into bone. A plurality of
10 circumferentially spaced-apart longitudinal grooves are provided
11 on the second portion adjacent its intersection with the shaft
12 portion. After insertion of the first and second portions across
13 a fracture, the shaft portion is removed. The grooves permit
14 rotation of the pin for removal should removal be necessary. A
15 driver for pin removal is also provided, as well as a mill tool.
